Web production

For my final website project, I will create an interactive and animated experience titled Chill Café. This fictional café is run by animals, including capybaras,ferrets, and cats. Each animal has a menu that reflects each animal's personality, environment, and quirks. Visitors to the site will be able to "order" items off the menu and, in doing so, meet the creatures behind each dish. The tone will be whimsical and inviting—like stepping into a warm, storybook-style digital café.

The site will include three HTML pages:

Home Page: A warm welcome to the café, with animated animals peeking out from booths or windows, and an introduction to the theme.

Menu Page: A clickable menu where each item represents a different animal. Clicking an item reveals animations, fun facts, and personality details about the animal.

Meet your match: An interactive experience where users select a menu item based on mood or flavor. Based on their choices, the matching creature (Capybara, Ferret, or Cat) is revealed as their café companion, complete with a cozy animation and a short message from the animal.

For coding, I think I'll use CSS animations to create subtle charm: animals blinking or waving, food steaming, and café lights gently flickering. Flex and Grid layouts will organize the menu and page sections neatly and responsively. If I incorporate open-source code (such as food drag-and-drop or animated café scenes), I will modify it significantly—adjusting visuals, interactions, timing, and structure to make the experience unique and creative.
